Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

(C (R-X)n-peptide where n = 1-10; X = C=0, when the R-X group is attached
(C to the N-terminus of the peptide, or a side chain of the peptide where
(C the functional group of the side chain is NH2 or OH; or X = O or NH,
(CC when the R-X group is attached to the C-terminus of the peptide, or a
(C side chain of the peptide, where the side chain functional group is COOH
(C or CONH2; and R = 2-18C alkyl or alkoxy, 2-14C alkylenyl containing one
(C or two double bonds, cyclobutyl, cyclopentyl, cyclohexyl optionally
(C on containing one
(C or two double bonds, cyclobutyl, cyclopentyl, cyclohexyl optionally
(C phenyl optionally monosubstituted with a 1-5C straight or branched chain alkyl group,
(C alkyl group, or benzyl. The peptides AAB37001-B37058 represent examples
(C of the peptide portion of the conjugate. The peptides represent analogues
(C of a Bcl-2 superfamily polypeptide corresponding to amino acids 72-97 of
(C the BH3 domain of the cell death agonist Bad. The peptide conjugate is
(C suseful for modulating apoptosis in the cells of a subject, or for
(C reversing B cell lymphoma/leukemia 2 (Bcl-2)-mediated blockage of
(C subject afflicted with a cancer characterized by cancer cells that
(C express Bcl-2. The cancer includes prostate, colorectal, gastric,
(C non-small lung, renal or thyroid cancers, neuroblastoma, melanoma, or
(C conjugate is also useful for treating disorders characterized by
(c increased apoptosis, e.g. neurodegenerative disorders, acquired
(C inmunodeficiency syndrome (AIDS), stroke or myocardial infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

CC (R-X)n-peptide where n = 1-10; X = C-0, when the R-X group is attached cc to the N-terminus of the peptide, or a side chain of the peptide where cc the functional group of the side chain is NH2 or OH; or X = O OR NH. CC when the R-X group is attached to the C-terminus of the peptide or a cc side chain of the peptide, where the Side chain functional group is COH cc or two double bonds, cyclobutyl, cyclopentyl, cyclohexyl containing one cc alkyl group, or benzyl where the side chain functional group is COH cc phenyl optionally monosubstituted with a 1-SC straight or branched chain alkyl group, or benzyl where peptides AAB37001-B3705B represent examples cc of the peptide portion of the conjugate. The peptides represent analogues of a Bcl-2 superfamily polypeptide corresponding to amino acids 72-97 of the BH3 domain of the cell death agonist Bad. The peptides conjugate is useful for modulating apoptosis in the cells of a subject, or for cc reversing B cell lymphoma/leukemia 2 (Bcl-2)-mediated blockage of gunction. In particular, the peptide conjugate is useful for treating a cancer cells. It is also useful for inhibiting Bcl-2 conjugate is cancer includes prostate, colorectal, gastric, consess Bcl-2. The cancer includes prostate, colorectal, gastric, conjugate is also useful for traating disorders characterized by cancer cells si also useful for traating a concersed apoptosis, e.g. neurodegenerative disorders, acquired confugate is also useful for traating disorders characterized by inmunodeficiency syndrome (AIDS), stroke or myocardial infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 18; Page 19; 74pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       treating neurodegenerative disorders, stroke, or cancer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a peptide conjugate having the formula:

CC (R-X)n-peptide where n = 1-10; x = C=0, when the R-X group is attached CC to the N-terminus of the peptide, or a side chain of the peptide where CC the functional group of the side chain is NH2 or OH; or X = O or NH, CC when the R-X group is attached to the C-terminus of the peptide, or a CC side chain of the peptide, where the side chain functional group is COH CC or two double bonds, cyclobutyl, cyclopentyl, cyclohexyl optionally CC monosubstituted with a 1-5C straight or branched chain alkyl group, CC phenyl optionally monosubstituted with a 1-5C straight or branched chain alkyl group, or benzyl. The peptides AAB37001-B37058 represent examples CC of the peptide portion of the conjugate. The peptides represent analogues of the BH3 domain of the cell death agonist Bad. The peptide conjugate is caseful for modulating apoptosis in the cells of a subject or for CC reversing B cell lymphoma/lukemia 2 (Bcl-2)-mediated blockage of subject afflicted with a cancer characterized by cancer cells that CC express Bcl-2. The cancer includes prostate, colorectal, gastric, CC non-small lung, renal or thyroid cancers, neuroblastoma, melanoma, or cacute or chronic lymphocytic and non-lymphocytic leukemia. The peptide conjugate is also useful for treating disorders, acquired immunodeficiency syndrome (AIDS), stroke or myocardial infarction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a peptide conjugate having the formula:

CC (R-X)n-peptide where n = 1-10; X = C=0, when the R-X group is attached CC to the functional group of the peptide, or a side chain of the peptide where CC the functional group of the side chain is NH2 or OH; or X = O or NH, CC when the R-X group is attached to the C-terminus of the peptide, or a CC when the R-X group is attached to the C-terminus of the peptide, or a CC consult of the peptide, where the side chain functional group is COOH CC or CONH2; and R = 2-18C alkyl or alkoxy, 2-14C alkylenyl containing one CC or two double bonds, cyclobutyl, cyclopentyl, cyclohexyl optionally monosubstituted with a 1-5C straight or branched chain alkyl group, or benzyl. The peptides AAB37001-B37058 represent examples cof the peptide portion of the conjugate. The peptide represent analogues of a Bcl-2 superfamily polypeptide corresponding to amino acids 72-97 of CC paptide for modulating apoptosis in the cells of a subject, or for capoptosis in cancer cells. It is also useful for inhibiting Bcl-2 conjugate is in cancer cells. It is also useful for inhibiting Bcl-2 conspets Bcl-2. The cancer includes prostate, colorectal, gastic, or con-small lung, renal or thyroid cancers, neuroblastoma, melanoma, or acute or chronic lymphocytic and non-lymphocytic leukemia. The peptide conjugate is also useful for treating disorders characterized by increased apoptosis, e.g. neurodegenerative disorders, acquired conjugate is useful for peptide conjugate is useful for treating and conjugate is also useful for treating disorders characterized by increased apoptosis, e.g. neurodegenerative disorders, acquired conjugate is useful for treating and conjugate is also useful for treating disorders characterized by increased apoptosis, e.g. neurodegenerative disorders, acquired conjugate is such and the peptide conjugate is mentioned by cancer cells that conjugate is also useful for treating disorders characterized by increased apoptosis, e.g. neurodegenerative disorders, acquired
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            δõ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                             RESULT
                                                                                                                                                                                                                                                                                                                         CC (R-X)n-peptide where n = 1-10; X = C=0, when the R-X group is attached CC to the N-terminus of the peptide, or a side chain of the peptide where CC the functional group of the side chain is NH2 or OH; or X = 0 or NH, CC when the R-X group is attached to the C-terminus of the peptide, or a Side chain of the peptide, where the side chain functional group is COOH CC or CONH2; and R = 2-18C alkyl or alkoxy, 2-14C alkylenyl containing one CC or two double bonds, cycloputyl, cyclopentyl, cyclopexyl optionally consubstituted with a 1-5C straight or branched chain alkyl group, cor benzyl. The peptides AB37001-B37058 represent examples cof the peptide portion of the conjugate. The peptide conjugate is cof a Bcl-2 superfamily polypeptide corresponding to amino acids 72-97 of CC the BH3 domain of the cell death agonist Bad. The peptide conjugate is consubstituted with a sponsat Bad. The peptide conjugate is consultating apoptosis in the cells of a subject, or for coversing B cell lymphoma/leukemia 2 (Bcl-2)-mediated blockage of capptosis in cancer cells. It is also useful for inhibiting Bcl-2 conjugate is apoptosis in cancer cells. It is also useful for inhibiting Bcl-2 conjugate is subject with a cancer characterized by cancer cells that cancer or chronic hymphocytic and non-lymphocytic leukemia. The peptide conjugate is also useful for treating a caute or chronic hymphocytic and non-lymphocytic leukemia. The peptide conjugate is also useful for treating disorders characterized by increased apoptosis, e.g. neurodegenerative disorders acquired infarction.
                                                                                                                                                                                                                                             Query Match

The present invention describes an isolated or synthetic polypeptide (C (I) comprising a less than full length amino acid sequence of a mutant CC Bcl-XL/Bcl-2 associated cell death regulator polypeptide (BAD) or its C fragment, which contains amino acid substitutions at Seril8 of a murine BAD). (I) has immunostimulant, neuroprotective, BAD (shorter murine BAD). (I) has immunostimulant, neuroprotective, antisribric, antisribric, antisribric, and immunostimulant, neuroprotective, and interthritic, antisribric, and immunosuppressive activities, and can be used as an apoptosis inducer or inhibitor. BAD polypeptides and CC can be used as an apoptosis inducer or inhibitor. BAD polypeptides and drugs cfor activity that promote cell survival or apoptosis. Other uses include cidentified and (mutant) BAD polypeptides are useful in treating compounded cidentified and (mutant) BAD polypeptides are useful in treating compounded cidenth, reperfusion cell death, wound healing, cancer, viral infections, clymphoproliferative conditions, arthritis, infertility, inflammation and cultonimune diseases. The present sequence represents a specifically and compounds architics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New mutant Bcl-XL/Bcl-2 Associated Cell Death Regulator polypeptide, useful for screening for candidate compounds which induce or inhibit apoptosis, comprises amino acid substitutions at Seril8, Seri55 or Seri13 -

Bad is a 22.1 kD protein which interacts with bcl-2 and bcl-x proteins and regulates cell death. It has homology to the bcl-2-related family clustered in the BH1 and BH2 domain. Bad has been found to hybridise to bcl-x(L) and bcl-2 in yeast two-hybrid assays and in vivo in mammalian cells. Overexpressed Bad counters the death inhibitory activity of bcl-x(L), but is much less effective at countering the death inhibitory activity of bcl-2. Bad expression can accelerate apoptotic cell death induced by cytokine deprivation in an IL-3 dependent cell line expressing bcl-x(L), and its also counters the death repressor activity of bcl-x(L). Bad competes with Bax for binding to bcl-x(L). Bad may be used to identify agents which inhibit its binding to bcl-2 or bcl-x(L) to form heterodimers. Such agents may be used to treat neurodegenerative diseases, immunodeficiency diseases,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Polynucleotide encoding bcl-x(L)/bcl-2 associated death promoter -useful to treat neoplasia and apoptosis and to identify agents inhibiting its binding to bcl-2 or bcl-x(L) to form heteromultimers

```
C? The present invention describes mutant BAD (BCL-XL/BCL-2 associated cell CC death regulator) proteins, having an amino acid other than Ser at CC postition 112 and/or 136, relative to the murine BAD 204 as sequence. The CC present sequence is the murine BAD protein Also described are: (1) CC fusion proteins of mutant BAD protein able to decrease cell viability; (2) CC fusion proteins of mutant BAD protein able to decrease cell viability; (2) CC increases intracellular delivery. Mutant BAD proteins are used to treat CC or prevent disease associated with reduced apoptosis, e.g. cancer, CC viral infection, lymphoproliferation, arthritis, infertility, contains and autoimmune disease. Polymuclactide sequences encoding CC mutant BAD proteins can be used similarly by gene therapy or to produce transgenic animals for use as disease. Polymuclactide sequences encoding CC mutant BAD proteins can be used similarly by gene therapy or to produce transgenic animals for use as disease models or in drug screening. BAD CC proteins phosphorylated at specified Ser are used to screen for enhancers CC ading or ischaemic cell death. The apoptosis such as AIDS, neurodegeneration, CC determined by measuring relative amounts of phosphorylated and noncell for the specified Ser, forming a proteins have greater death-promoting activity than wild-type BAD which can become CC phosphorylated on the specified Ser, forming a product that does not the transport of the specified Ser, forming a product that does not contain the cytosol, thus promoting cell survival. The mutants with CC ser substituted cannot bind 14-3-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI; 1998-261422/23

                                                                                                                                                                                                                                  В
                                                                                                                                                                                                                                                               ŝ
                                                                                                                                                                                                                                                                                                                                                                                        CC The present invention describes mutant BAD (BCL-XL/BCL-2 associated cell CC death regulator) proteins, having an mino acid other than Ser at CC position 112 and/or 136, relative to the murine BAD 204 has sequence. The position 12 and/or 136, relative to the murine BAD 204 has sequence. The CC present sequence represents a mutant BAD protein. Also described are: (1) CC fragments of mutant BAD protein able to decrease cell viability; (2) CC fusion proteins of mutant BAD protein able to decrease cell viability; (2) CC inflammation and autoimmune disease. Polynucleotise sequences encoding CC inflammation and autoimmune disease. Polynucleotide sequences encoding CC mutant BAD proteins can be used similarly by gene therapy or to produce transgenic animals for use as disease models or in drug screening. BAD CC proteins phosphorylated at specified Ser are used to screen for enhancers and inhibitors of serine-phosphatase. Inhibitors are potentially useful CC in treatment of excessive apoptosis such as AIDS, neurodegeneration, CC aging or ischaemic cell death. The apoptotic status of cells is determined by measuring relative amounts of phosphorylated and non-CC phosphorylated BAD, by usual immunoassays. Mutant BAD proteins have composited Ser, forming a product that does not the total activity than wild-type BAD which can become CC phosphorylated on the specified Ser, forming a product that does not the cooldmerise with BCL-2 or BCL-XL but instead binds to 14-3-3 family CC ser substituted cannot bind 14-3-3.
                                                                                                                                                                                                                                                                                                     Matches

                                                                                                                             ş
                                                                                                                                                                                                                                                                                       CC death regulator) proteins, having an mano acid other than Ser at CC position 112 and/or 136, relative to the murine BAD 204 as sequence. The CC position 112 and/or 136, relative to the murine BAD 204 as sequence. The CC present sequence represents a mutant BAD protein. Also described are: (1) CC fragments of mutant BAD protein able to decrease cell viability, (2) CC fusion proteins of mutant BAD protein able to decrease cell viability, (2) CC fusion proteins of mutant BAD proteins are used to treat CC or prevent diseases associated with reduced apoptosis, e.g. cancer, CC viral infection, lymphoproliferation, arthritis, infertility, cancer, CC viral infection, lymphoproliferation, arthritis, infertility. Cancer, CC inflammation and autoimmune disease, polynucleotide sequences encoding CC mutant BAD proteins can be used similarly by gene therapy or to produce transgenic animals for use as disease models or in drug screening. BAD CC proteins phosphorylated at specified Ser are used to screen for enhancers and inhibitors of serine-phosphatase. Inhibitors are potentially useful CC in treatment of excessive apoptosis such as AIDS, neurodegeneration, CC aging or ischaemic cell death. The apoptotic status of cells is concerning to the complex of the complex of the complex of the complex of the specified Ser, forming a proteins have composited BAD, by usual immunossays. Mutant BAD proteins have composited ser, forming a product that does not the treatment of the specified Ser, torming a product that does not contain the cytosol, thus promoting cell survival. The mutants with cC ser substituted cannot bind 14-3-3.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes mutant BAD (BCL-XL/BCL-2 associated cell CC death regulator) proteins, having an amino acid other than Ser at CC position 112 and/or 136, relative to the murine BAD 204 as sequence. The CC present sequence represents a mutant BAD protein. Also described are: (1) CC fragments of mutant BAD protein able to decrease cell viability; (2) CC fusion proteins of mutant BAD with a heterologous polypeptide that CC or prevent diseases associated with reduced apoptosis, e.g. cancer, CC viral infection, lymphoproliferation, arthritis, infertility, CC inflammation and autoimmune disease. Polypholeotide sequences encoding CC mutant BAD proteins can be used similarly by gene therapy or to produce transgenic animals for use as disease models or in drug screening. BAD CC proteins phosphorylated at specified Ser are used to screen for enhancers CC and inhibitors of serine-phosphatase. Inhibitors are potentially useful in treatment of excessive apoptosis such as AIDS, neurodegeneration, CC aging or ischaemic cell death. The apoptotic status of cells is. CC determined by measuring relative amounts of phosphorylated and non-phosphorylated BAD, by usual immunoassays. Mutant BAD proteins have CC greater death-promoting activity than wild-type BAD which can become CC phosphorylated on the specified Ser, forming a product that does not the topic with BCL-2 or BCL-XL but instead binds to 14-3-3 family CC proteins in the cycosol, thus promoting cell survival. The mutants with CC Ser substituted cannot bind 14-3-3.
                                                                                                                                                                                                                                                                                                                                                                                                 В

                                                                                                                                                                                     This sequence represents a novel serine-phosphorylated protein, BAD (BC1-X1/BC1-2 associated cell death regulator). The serine residue is phosporylated in a post-translational modification and allows binding to the 14-3-3 protein which is a signal transduction regulator. Modulators of phosphorylated BAD, which act through inhibition/activation of a phosphoserine phosphatase, are useful for preventing/treating increased/decreased apoptosis in a cell. The increased apoptosis may result from immunodeficiency disease, senescence, neurodegenerative disease, ischaemic cell death, reperfusion cell death, infertility and wound-healing. Decreased apoptosis may result from cancer, viral inflammation and autoimmune diseases. Measuring the amount of phosphorylated compared to unphosphorylated BAD polypeptide and/or total phosphorylated compared to unphosphorylated BAD polypeptide and/or total
                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Serine-phosphorylated Bcl-X-1/Bcl-2 Associated cell Death regulator polypeptide - useful for modulation of apoptosis associated with,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes an isolated or synthetic polypeptide (I) comprising a less than full length amino acid sequence of a mutant CC Bcl-XL/Rcl-2 associated cell death regulator polypeptide (BAD) or its general sequence, and the contains amino acid substitutions at Seril3 of a human CC BAD, SeriS5 of a murine BAD (longer murine BAD) or Seril3 of a murine BAD). (I) has immunostimulant, neuroprotective, concurrence, antiischaemic, vulnerary, cytostatic, antiviral, contropic, antiischaemic, vulnerary, cytostatic, antiviral, and drugs can be used as an apoptosis inducer or inhibitor. BAD polypeptides and cc polynucleotides can be used for screening candidate compounds and drugs cf or activity that promote cell survival or apoptosis. Other uses include identified and (mutant) BAD polypeptides are useful in treating candidate compounds and conducing or inhibiting apoptosis in a cell. Candidate compounds conducing or inhibiting apoptosis in a cell. Candidate compounds conducing or inhibiting apoptosis in a cell. Candidate compounds conducing or inhibiting apoptosis in a cell. Candidate compounds conducting or inhibiting apoptosis in a cell. Candidate compounds conducting or inhibiting apoptosis in a cell. Candidate compounds conducting or inhibiting apoptosis in a cell. Candidate compounds cell death, reperfusion cell death, wound healing, cancer, viral infections, content in the conductions of the present sequence represents a specifically content of the present con

                                                                                                                                                                                                                                                                                                                           inker to diphtheria toxin translocation domain (DTTR). The functional apoptosis modifying fusion protein is capable of binding a target cell and integrating into or crossing a cellular membrane of the target cell. The apoptosis-modifying fusion protein comprises at least two domains: the DTR domain, which targets the fusion protein to the target cell and the Bcl-XL domain, which modifies an apoptotic response of the target cell. The fusion protein is useful for modifying (inhibiting or enhancing) apoptosis in a target cell, such as neuron, lymphocyte, cancer, neoplasm, macrophage, epithelial, stem, tumour or hyper-proliferative cell or an adipocyte. It is also useful for reducing apoptosis in a subject after transient ischaemic neuronal injury, especially spinal cord injury. The fusion protein may be used to treat various diseases and injury conditions through inhibition or enhancement of apoptotic cellular response, including neurodegenerative discreters such as Alzheimer's disease, Huntington's disease, spinal muscular atrophy, stroke episodes and unregulated cell growth as in tumours and various cancers. The apoptosis-modifying fusion protein can be delivered cells accers. The apoptosis-modifying fusion protein can be delivered cells.
                                                                                                                                                                                                                                             Matches

                                                                                                                                                                                                                  The present sequence represents a protein of 166 amino acids. The sequence is disclosed as being a protein called BBE66 which regulates cell death through interaction with Bcl-2. The DNA may be used for the production of the recombinant protein, which can be used in unspecified therapeutic or diagnostic procedures, as a molecular weight marker, and to raise antibodies that can be used in unspecified diagnostic or therapeutic applications and to reduce or eliminate the biological activity of the BBC6 protein in vivo.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

MEDIUM TYPE: Ploppy disk

COMPUTER: IHM PC COMPUTEN: DC-DOS/MS-DOS

OPERATING SYSTEM: PC-DOS/MS-DOS

SOFTWARE: PATENTIO Release #1.0, Ve

CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/333,565

FILING DATE: 31-OCT-194

CLASSIFICATION: 435

ATTORNEY/AGENT INFORMATION:

NAME: Smith, William M

REGISTRATION NUMBER: 30,223

REFERENCE/DOCKET NUMBER: 15726A-00

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  5
Sequence 1, Application US/08733505A
Patent No. 5856445
GENERAL INFORMATION:
APPLICANT: KORSMEYER, STANLEY J.
TITLE OF INVENTION: SERINE SUBSTITUTED MUTANTS OF
TITLE OF INVENTION: BCL-XL/BCL-2 ASSOCIATED CELL DEATH REGULATOR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 2, Application US/08661479 Patent No. 5834209 GENERAL INFORMATION:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             MEDIUM TYPE: Floppy disk
COMPOUTER: IBM PC compatible
OPERATIOG SYSTEM: PC-LOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/661,479
FILING DATE: 11-JUN-1995
CLASSIFICATION DATA:
APPLICATION NUMBER: US 08/333,565
PRIOR APPLICATION NUMBER: US 08/333,565
PRIOR APPLICATION NUMBER: 31-CCT-1994
ATTORNEY/ACENT INFONMATION:
NAME: Smith, William M
REGISTRATION NUMBER: 15726a-000700

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

C; Date: 24-Mar-1995 #Sequence_revision of maize annexins P33 and P10-1995 #T00-1995 #
A;Status: preliminary
A;Molecule type: DNA
A;Molecule type: DNA
A;Residues: 1-206 <CASS
A;Cross-references: GB:M55177
A;Cross-references: GB:M55177
C;Superfamily: ras transforming protein; translation elongation factor Tu homology
C;Reywords: GTP binding; nucleotide binding; P-loop
F;I1-126/Domain: translation elongation factor Tu homology <ETU>
F;17-24/Region: nucleotide-binding motif A (P-loop)
F;113-126/Region: GTP-binding SAK/L motif
F;133-126/Region: GTP-binding SAK/L motif
F;23,24,42,123,124,126,183/Binding site: Mg-GTP (Lys, Ser, Thr, Asn, Lys, Asp, Ser)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              transforming protein homolog MRAS3 - Rhizomucor racemosus C;Species: Rhizomucor racemosus C;Species: Rhizomucor racemosus C;Date: 28-Mar-1991 *sequence_revision 28-Mar-1991 *text_change 19-Jan-2001 C;Accession: C36365 R;Casale, W.L.; McConnell, D.G.; Wang, S.Y.; Lee, Y.J.; Linz, J.E. DOMAIN: Intact BH3 domain is required by BIK, BID, BAK, BAD AND BAX for their pro-apoptotic activity and for their interaction with anti-apoptotic members of the Bcl-2 family.

PM: Phosphorylated on Ser-113 in response to survival stimuli. Subsequent phosphorylation on Ser-137 promotes heterodimerization with 14-3-3 proteins. This interaction then facilitates the phosphorylation at Ser-156, a site within the BH3 domain, leading to the release of Bcl-x(L) and the promotion of cell survival. Ser-137 is the major site of AKT/PKB phosphorylation, Ser-156 the major site of protein kinase A (CAPK) phosphorylation (By Similarity).

SIMILARITY: CONTAINS A BCL-3 HOMOLOGY DOMAIN 3 (BH3).
                                                                                                                                                                                                                                                                                                                                                    EMBL;

Can reverse the death repressor activity of Bcl-x(L), but not that of Bcl-2 (By similarity). Appears to act as a link between growth factor receptor signaling and the apoptotic pathways. SUBUNIT: Forms heterodimers with the anti-apoptotic proteins. SUBUNIT: Forms heterodimers with the anti-apoptotic proteins. Bcl x(L), Bcl-2 and Bcl-w, Also binds protein S100A10. The Ser-117/Ser-137 phosphorylated form binds 14-3-3 proteins. SUBCELULIAR LOCATION: Outer mitochondrial membrane. Upon phosphorylation, locates to the cytoplasm (By similarity). ALTERNATIVE PRODUCTS: 2 isoforms; alpha (shown here) and beta; arproduced by alternative splicing. They differ only in their C-terminal regions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                TISSUE SPECIFICITY: Expressed in all tissues tested, including brain, liver, spleen and heart. In the brain, restricted to epithelial cells of the choroid plexus. Isoform alpha is the m

Mammalia; Eutheria; Primates; Catarrhini; Hominidae
binding to Bcl-x(L), Bcl-2 and Bcl-w, thereby affecting the level of heterodimerization of these proteins with BAX. Can reverse the death repressor activity of Bcl-x(L), but not that of Bcl-2 (By similarity), Appears to act as a link between growth factor receptor signaling and the apoptotic pathways.

1. Subunt: Forms heterodimers with the anti-apoptotic proteins, Bcl-x(L), Bcl-2 and Bcl-w. Also binds protein Sl00Al0 (By similarity). The Ser-75/Ser-99 phosphorylated form binds 14-3-3 proteins (By similarity).

2. Subcellular Location. Outer mitochondrial membrane. Upon phosphorylation, locates to the cytoplasm.

1. TISSUE SPECIFICITY: EXPRESSED IN A WIDE VARIETY OF TISSUES.

1. DOMAIN: Intact BH3 domain is required by BIK, BID, BAK, BAD AND BAX for their pro-apoptotic activity and for their interaction with anti-apoptotic members of the Bcl-2 family.
                                                                                                                                                                                                                                                                                                                             [6]

Subsequent phosphorylation on Ser-99 promotes heterodimerization with 14-3-3 proteins. This interaction then facilitates the phosphorylation at Ser-118, a sitt within the BH3 domain, leading to the release of Bcl-x(L) and the promotion of cell survival. Ser-99 is the major site of AKT/PKB phosphorylation, Ser-118 the major site of protein kinase A (CAPK) phosphorylation (by
